TITLE: Important parameters of differently oriented quartz resonators of the NT type

SOURCE: Slaboprudy obzor, v. 26, no. 1, 1965, 31-36

TOPIC TAGS: piezoelectric crystal, quartz, resonator, crystal orientation

ABSTRACT:

Piezoelectric quartz resonators of the NT type are used in the frequency range of 10 to 70 kc. The basic parameters of the resonators depend on the accurate orientation of the crystals. Partial results are presented from studying the influence of crystal orientation on the temperature dependence of the resonance frequency, on the inductivity, and on the ratio of the series and parallel capacitances in the electrical equivalent circuit of NT resonators that have an orientation $X\theta 1_{-\psi}$ when $\psi = 0$ to $+8.5^\circ$ and $\psi = 0$ to 160° . TITLE: Influence of the DC electrical field on the resonance frequency of DKT
piezoelectric resonators

SOURCE: Elektrotechnicky casopis, no. 3, 1966, 161-167

TOPIC TAGS: piezoelectric crystal, electric field, direct current

ABSTRACT: Just as in the case of quartz piezoelectric resonators it was observed
with DKT resonators that the DC electrical field influences their resonance frequency.
The temperature dependence of that influence was investigated. From experimental
measurements the components g_{241} and g_{341} of the polarization correction tensor of
the elastic coefficients were calculated for DKT and proved to be more than order
larger than the corresponding known components of natural quartz. This paper was
presented by K. Cernik. The authors thank workers of Department of Physics,
B. Kantur and Scientific Aspirant, Engineer K. Dadour for assistance with the
measurements and calculations. Orig. art. has: 1 figure, 8 formulas and 2 tables.

1592. ZELENKA J. and ČAPEK V. Dětsk. Odd. OÚNZ, Cheb. *Pseudocoeliakální syndrom u TBC střev batolete 18 měsíců starého. Pseudocoeliac syndrome in an intestinal tb process in an 18-month-old child CSL. PEDIAT. 1955, 10/9 (701-706) Graphs 1 illus. 2

The tb infection of the intestine of an 18-month-old child is described, where both medical history and clinical state gave the impression, from the beginning, of a coeliac syndrome. From the history, the first characteristic coeliac stools occurred at the age of 13 months, accompanied by loss of weight (4,000 g), loss of ability to walk and profound change in the behaviour of the child. On admission at 19 months, the child manifested the typical clinical symptoms of coeliac disease, that is, extreme wasting, abdominal distension, clinical evidence of vitamin- and mineral-deficiencies, marked anorexia, bursts of temper alternating with periods of great timidity. But the normal blood sugar curve in the glucose tolerance test, normal blood level of cholesterol and serum protein, positive tuberculin reactions and the roentgenogram of caecum ascendens revealed changes typical of tb enterocolitis (porto-phenomenon). Very probably it was a primary tb from drinking un-boiled cow's milk. With streptomycin and PAS the child recovered in 10 weeks. Control examination 1 yr after dismissal showed a healthy child with a quite asymptomatic stenosis of caecum.

TITLE: Properties of diesel fuels at low temperatures

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 2, 1963, 465-466,
abstract 2P159 (Ropa a uhlie, v.4, no.5, 1962, 145-149 [Czech;
summaries in Russ., Fr., Eng., and Ger.])

TEXT: The properties at low temperatures of four diesel fuels (with
b.p. 170-340°C) manufactured in Czechoslovakia were investigated, as well
as the influence on these properties of the following depressors:
AZNIA OCT 8443-57 (GOST 8443-57), Fluxan E (Badische Anilin u. Soda
Fabrik, FRG), and Santopour (Monsanto, England). The laboratory tests
performed included: pour point, crystallization point, the temperature of
paraffin separation (TPS), extreme temperature of filtration (ETF)
according to DIN 51570, and viscosity between 0° and -35°C, at 5°C
intervals. Low-temperature properties of the fuels were evaluated
according to the ETF determined during the test in a Tatra-928 motor in
a cooling chamber; the temperature was lowered stepwise by 5°C until it

Card 1/2

Properties of diesel fuels at ...

S/061/63/000/002/072/088
B149/B144

caused unsatisfactory results; the lowest temperature at which the results were still satisfactory was taken as the ETF. The addition to the fuels of depressors lowered the pour point (from 5° to 15° C) and slightly increased the viscosity, but practically did not affect the crystallization point, TPS, ETF according to DIN 51700, or the results of motor tests. The pour point does not correspond to the ETF in the motor test, and the difference between ETF in the motor and the pour point varies from fuel to fuel; the crystallization point and ETF according to DIN 51770 are closer to ETF in a motor test, and TPS corresponds well to it. The results obtained (fuel, pour point in °C, ETF according to DIN 51770 in °C, TPS in °C, ETF in the motor in °C) are listed as follows: hydrated NM-30, -34, -23, -24, -25; hydrated NM-30 + 0.2% of AZNIA additive -43, -26, -24, -25; NM-30 distillate from a mixture of Romashkino and Mukhanovskaya crudes, -39, -26, -33, -35; the same + 0.2% of AZNIA additive -43, -28, -32, -35; NM-30 (a mixture of 70% of Anastas'yevka petroleum distillate and 30% of Saratov distillate) -50, -28, -26, -25. It was also found that the addition of Saratov petroleum distillate considerably impaired the low-temperature properties of Anastas'yevka petroleum distillate. [Abstracter's note: Complete translation.]

Orig Pub : Veterin. arh., 1956, 26, No 5-6, 165-173.

Abstract : Sixteen cases of leptospirosis of horses were under obser-
vation. In 3 of them the causative agent, Leptospira
pomona, was isolated. The disease occurred in summertime
and was characterized by a high fever, depression, loss of
appetite, jaundice, and an acute hyperemia of the vessels
of the conjunctive and sclera. In some instances, a skin
rash and lesions of the eye were observed. The apparent
source of infection were pigs which used the same stagnant
water as horses. Meteorological conditions (rainy summer)
favored the development of the disease. The treatment

Title	: The Utilization of Potato Starch Factory Wastes	
Orig Pub.	: Staerke, 10, No 10, 254-262 (1958)	
Abstract	: The author has investigated the possibility of the utilization of potato starch plant wastes (gluten liquors and mash). The gluten liquors (GL) and the steep waters obtained in cornstarch production differ very little in chemical composition. A process has been developed for producing an active dry substance from the GL. Pure cultures of lactobacillus are added to undiluted, weakly acidified [sic] sulfuric acid and GL heated to 48-50°. After lactobacillus fermentation of the GL the latter cooked and dried, giving a powdered product containing 95% solids. The product obtained has been used under

Abstract : laboratory conditions as a growth stimulant for mold fungi in the production of medicinal preparations. Corn extract was used as a comparison standard with an activity arbitrarily set at 100%. Under optimum application conditions the product obtained from GL gave the following results in the applications listed: production of penicillin, 145%; streptomycin, 100%; chlorotetracyclin, 105%. The product obtained from GL can be used as a stimulant in a number of fermentation processes: e.g., the production of alcohol from molasses, the production of yeast cakes, the production of lactic and citric

Title : New Data Obtained in the Process of Saccharification of Potato Mash with Amylolytic Preparations. Pilot Plant Experiments with Mold Preparations in Producing Alcohol From Potatoes.

Orig Pub: Ceskosl. Microbiol., 1956, 1, No 5, 193-203.

Abstract: Experiments were conducted concerning the saccharification of potato mash with *Aspergillus niger* and a mixture of it with *Aspergillus oryzae*, with the subsequent fermentation to alcohol. Fungi (preparations) were used in the experiments which [fungi] were grown on sterile siftings and were

Card 1/3

CZECHOSLOVAKIA / Chemical Technology. Fermentation H-27
Industry.

Abs Jour: Ref Zhur-Khimiya, No 23, 1958, 79258.

Abstract: air-dried. The saccharification of mash with an 8-day old brewing green malt was used as a control. An experimental set-up is described. One hundred forty kilograms of potatoes containing 20% starch was boiled to a pulp in an autoclave in the usual way and then was passed into a brewing tank into which amylolytic preparations in an amount of 17.6% per starch weight were added in three steps: (at the beginning, in the middle and at the end of the drawing off). The saccharification was carried out for one hour at 50-55°C. In certain instances the mash was acidified with sulfuric acid to a pH of 4.5. Saccharified mash was cooled to 22-25°C. and after 0.5 kilograms of pressed yeast had been added, the contents were subjected to fermentation

Card 2/3

CZECHOSLOVAKIA / Chemical Technology. Fermentation H-27
Industry.

Abs Jour: Ref Zhur-Khimiya, No 23, 1958, 79258.

Abstract: for 72 hours. In control experiments 15.9% of malt was added (per weight of the starch) and the saccharification was carried out for one hour at 49°C. The saccharification of potato mash with the mixture of *Asp. niger* and *Asp. oryzae* or with *Asp. niger* proceeded without any difficulties, and more rapidly than in the control experiments. The mash, in which the saccharification was caused by fungi preparations, produced a larger alcohol yield than those saccharified by malt. The quality of raw alcohol was the same. In the case when *Asp. oryzae* was used, galactose was formed during the process of fermentation.

Title : The Blood Pressure and Blood Levels of -globulin in Rabbits Associated with the Injection of Renin into the Portal Circulation.

Orig Pub : Univ. carolina. Med., 1956, 2, No 3, 365-371

Abstract : The injection of renin into the hepatic portal system of rabbits through the mesenteric vein produced loss of a pressor effect and loss of a reduction in the blood level of -globulins than its injection into the jugular vein. Injection of renin into the jugular vein following its injection into the portal system resulted in the phenomenon of tachyphylaxis, while its injection into the portal system after injection into the jugular vein exerted no additional effect upon blood pressure. The liver apparently participates in the enzymatic uncoupling of the hypertension being

Pregnanediol determination and some values in pregnancy. F. Poláček and V. Zelenka. *Cd. Gynack.* 13, 430-40 (1948).—A modification of Huber's (*C.L.* 42, 3015) chromatographic method for pregnanediol detn. is described. It consists in double extn. and in purification of the product by acetone pptn., which results in nearly pure Na pregnanediol glucuronide. The modification is precise and quick (3 hrs. for 0.15 mg.). Comparison of this test with the Friedmann reaction showed the pregnanediol-excretion-test to be reliable as a pregnancy-test only in the later stages of pregnancy, as during the 1st and 2nd months values approximate those of the normal secretory phase of the menstrual cycle. Twenty-five detns. in 10 cases of normal pregnancy showed normal values, though cases receiving progesterone prophylactically showed increased values. Twenty-eight detns. in 23 cases of abnormal pregnancy showed: (1) normal values in ectopic pregnancy and hydatid mole (2 cases each); (2) frequently lowered values in cases of threatened abortion or premature birth; (3) much lower values in complete abortions and premature births; (4) in cases of intrauterine death, lowered values at the 2nd control examn. indicative of impending delivery; (5) lower values in pre-eclamptic toxemia. B.A.
